

what kubernetes doesnt do

Kubernetes is like a boss for apps, making sure they're doing their job and growing when needed. But it doesn't write code, set up fancy rules, or check if the apps are super healthy inside. For extra cool features, like smart storage and detailed checks, we'd want other helpers. It's good at basic balancing and growing your apps, but for special tweaks, we might need to call in some extra help.

What other Orchestration tools are available other than Kubernetes

Apart from Kubernetes, there are other tools like Docker Swarm, Apache Mesos, Amazon ECS, Azure Container Instances, Nomad, OpenShift, Rancher, and GKE. They each have their own strengths and are used based on factors like simplicity, integration, and specific platform preferences.
